

HP positive

Treat HP

HP negative

Reassure, as negative predictive value of all tests is >95%

Only retest for HP if duodenal ulcer, gastric ulcer, family history of cancer, MALToma, or if test was performed within 2 weeks of PPI, or 4 weeks of antibiotics

If HP negative, treat as functional dyspepsia. Step down to lowest dose PPI or H₂ agonist needed to control symptoms. Review annually, including PPI need.

Asymptomatic post-HP treatment
